A SMARTER WAY TO RUN A SMALL SHOP

Small shop. Big flow.

Self-service shopping that keeps the customer moving and gives the team a clear view of products, orders, balances and sales.

- Scan-to-cart
- Staff-controlled tabs
- Useful store insights
- Self-hosted

KIOSK APP · RETAIL, MADE REFRESHINGLY PRACTICAL

THE EVERYDAY SHOP CHALLENGE

Less friction at the shelf.
More clarity behind the counter.

A small store still needs a smooth way to browse, buy, keep stock straight and follow up on what is owed.

Make self-service simple

Let customers browse categories, search, build a cart and check out on a shared kiosk.

Turn scans into items

Use common keyboard-style barcode scanners to find products and add them directly to the cart.

Keep tabs visible

See pending balances, order history and payment status in the staff-facing admin panel.

THE SHOPPING FLOW

From beep to basket.

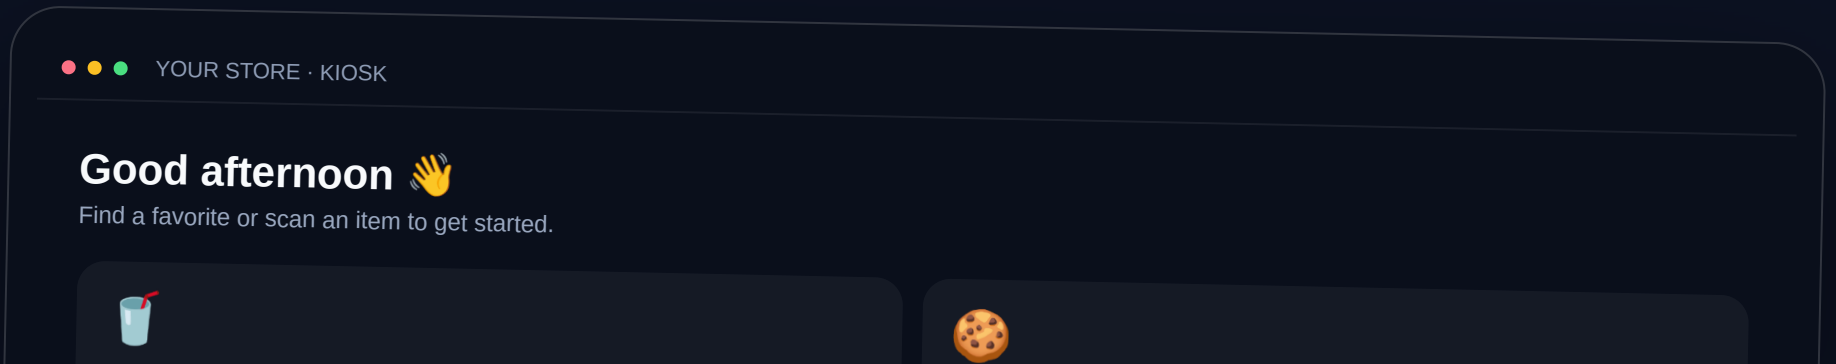

A scanner behaves like a keyboard: scan the code, the kiosk looks up the active product, and the shopper keeps moving.

01 **Staff set it up once**
Attach one or more unique barcode aliases to a product in the admin panel.

02 **Shopper scans**
Scan a barcode into the kiosk field using a USB or Bluetooth HID scanner.

03 **Item lands in the cart**
The matched active product is added; scanning again increases its quantity.

04 **Checkout stays connected**
Stock is checked and the purchase is recorded on the customer's tab.

A BETTER STORE TOOLKIT

Everything essential.
Nothing needlessly complicated.

Customer-first kiosk

Product categories, search, photos, weekly specials, cart totals and customer lookup in one touchscreen-friendly flow.

Flexible barcode setup

Support several barcode aliases for a product; keep lookup exact and shared across product setup and shopping.

Staff stays in charge

Review orders, mark payments, manage stock and control products from the admin panel.

See what is happening

Review customer and product rankings, outstanding balances and sales across day, week and month views.

KNOW THE SHOP, NOT JUST THE CHECKOUT

Turn daily activity into useful answers.

The admin experience brings operational detail into view—without turning the shop into a spreadsheet project.

Top customers

Ranked by paid spend across day, week and month.

Popular products

Most-purchased items and units sold over time.

Payment visibility

Pending balances and recent payment activity at a glance.

Customer context

Order history and useful per-customer statistics.

Insights are based on the data recorded by the store; the app does not claim to forecast demand.

A PRACTICAL OPERATING MODEL

Checkout for a tab-based shop.

Kiosk App records orders for staff to reconcile later. It is not a payment processor or a card terminal.

- **Order recorded**
  Stock is checked and purchase-time item details are saved.
- **Balance stays visible**
  Pending orders contribute to the customer's balance and admin views.
- **Staff closes the loop**
  Mark orders paid, cancel pending orders or reset payment for a customer.

BUILT FOR YOUR OWN ENVIRONMENT

Your shop. Your data. Your deployment.

Run the app with Docker Compose and keep store data in a local SQLite file. The documented runtime does not make outbound network calls; online access is needed to build or obtain container images.

Self-hosted · Docker Compose · SQLite

SIMPLE ON THE SURFACE. THOUGHTFUL UNDERNEATH.

Made to be run, not just demoed.

A lightweight web stack, persistent store data, HTTPS at the frontend, automatic database migrations and an offline deployment path.

YOUR NEXT SHOP SHIFT CAN FEEL SIMPLER

A friendly kiosk for customers.
A clearer picture for staff.

See the interactive demo, explore the code, or bring up your own instance with Docker Compose.

Kiosk App is a self-hosted store-kiosk project. Features described here are based on the current repository implementation; actual operation depends on local setup and store processes.
